

METHOD FOR SEALING ELECTROLUMINESCENCE DISPLAY DEVICES

ABSTRACT

[0032] A method is disclosed for encapsulating at least one display device. A plurality of parallel openings are formed in a first material layer on a first substrate to expose a second material layer underneath. A predetermined sealant is placed thereon to form a sealant region perpendicular to the openings for attaching a second substrate, wherein the sealant contacts the first material layer and the second material layer through the openings for encapsulating the display device between the first and second substrates.
